REVISION HISTORY	3

Description - Contains an overview of the theory of the Transceiver Processing and Storage (TPS) / Integrated System Electronics (ISE) subsystem.

1- INTRODUCTION

The TPS/ISE subsystem performs all the data collection and reconstruction of RF signals. It receives commands and RF waveform information via the host computer and the IPG. It communicates to the host computer through the VME Interface Board (VME I/F). The Combined Exciter Receiver DAB (CERD) module receives IPG data via the TPS/ISE backplane. These inputs are combined to generate real-time RF waveforms which are sent to the RF/Pen Amplifier Cabinet. The detected signal (by the RF coil) is demodulated by the CERD, which also performs any preprocessing before transferring the data to the memory board(s). It also reconstructs the raw data into an image file(s), which is later transferred to the host computer disk drive via the VME I/F Board.

REVISION HISTORY

REV	DATE	AUTHOR	PRIMARY REASONS FOR CHANGE
0	June 2, 1998	J. Saperstein	Initial Conversion from Toolbook to Word.
1	Oct 13, 1999	M. Keber	Added correct proprietary heading to document.
