

COMPUTER FILE CLEAN UP

1. Verify your disk space:

On a command window type: `df -h [ENTER]`

Look for the `/export/home` and `/export/home1`. If one of them is missing it indicates a problem with the hard drive or the software load.

The partitions should be less than 80% full.

2. Remove patient images from the browser:

3. Remove core files:

```
cd /usr/g/service/log
```

```
rm -rf core*
```

```
rm vx*
```

4. Remove any SPR SNAP files:

This are files GE used to diagnose problems and send to engineering. It will be a directory name like the hospital name. Type that instead of "directoryname"

```
rm -rf /usr/g/service/log/"directoryname"
```

5. Remove raw data files:

```
cd /usr/g/mrraw
```

```
rm -f p* (do not delete a file named "HEADER_POOL")
```

6. Run storelog (it does not remove everything unless is ran when applications is down. **It wipes the error log so make sure you are not going to need it!!**):

```
/usr/g/bin/storelog
```

7. Clean the Networking log:

```
cd /usr/g/hisris
```

```
ls -sal wlsErrors
```

```
echo>wlsErrors
```

8. Remove temp files from the insite directory:

```
cd /usr/g/insite/data
```

```
rm *
```

9. Prune messages, wtmp and wtmpx files:

su –

cd /var/adm

cp /dev/null messages

cp /dev/null wtmp

cp /dev/null wtmpx

10. Clear the Archive Queue:

cp /dev/null /export/home/sdc/app-defaults/archive/vdi.log

11. Remove IRIX crash logs in 9x systems:

cd /var/adm/crash

ls -sal

remove any large files
