

Number of Locks Required for Full Energy Isolation = 2

The diagram illustrates the H1/G1 MRI system layout, showing the central magnet assembly and its connection to various support systems. The central magnet assembly includes the Magnet, Cryogenics, XRGB Gradient Coil, XRGB RF Body Coil, and Front Bridge Assembly. It is surrounded by Magnet Mounted Enclosures, Enclosure Mounting Ring, and Enclosure Mount. The system is supported by several cabinets and panels, including the Heat Exchanger Cabinet (HEC), Power, Gradient, RF Cabinet (PGR), Penetration Cabinet (PEN), Secondary Penetration Wall (SPW), and Main Disconnect Panel (MDP). The diagram also shows the Cryo Cooler Compressor (CRY) and the Ramp Shim Access & Brainwave (RSAB) unit. The layout is divided into three main sections: the central magnet assembly, the support cabinets, and the cryogenics system. The central magnet assembly is connected to the support cabinets via power, data, and cryogenics lines. The support cabinets are connected to the cryogenics system via power and data lines. The cryogenics system is connected to the central magnet assembly via cryogenics lines. The diagram is a detailed schematic of the H1/G1 MRI system layout, showing the central magnet assembly and its connection to various support systems.
